# introduction to pandas==>
# pandas is an open-source library which is used for bhandle data manipulator
```

```
import pandas as pd
```

```
# data structure odf pandas ==>
# 1.series ==> it is one-dimentional array and it returns only values not column name
# 2.dataframe ==> it is multi dimensional array and it returns values with name
```

```
#series
a=pd.Series([1,34,78,90])
```

```
type(a)
```

```
pandas.core.series.Series

```
Parameters
----------
data : array-like, Iterable, dict, or scalar value
    Contains data stored in Series. If data is a dict, argument order is
    maintained.
index : array-like or Index (1d)
```

```
# dataframe
